

## Multi-port USB hub allows up to seven ST series Microwave sensors to be connected at one time

By using a standard USB hub it is possible to connect up to seven ST series Microwave sensors at one time. This allows multi-port measurements, which is useful for situations such as satellite transponder testing where multiple measurements are required for production test.

By connecting multiple hubs it's possible to have 127 sensors connected at one time.

The illustration above shows a Satori ST series Microwave sensor connected to a seven-port USB hub.
